6.1.4 — Factors Influencing Eyewitness Memory

Student Notes Workbook · 学习笔记工作册

post-event information（事件后信息）· stress and trauma（压力与创伤）· weapon focus（武器聚焦）· other-race effect（异族效应）

Name 姓名: _____ Class 班级: _____ Start date: _____

How to use this workbook 使用方法

1. **Read one section of the courseware, then fill the matching page.** 边读课件边填空——填空的价值在于"想不起来"的那一刻。
2. **Every study = who · what · number.** 每个研究记三样：谁（被试）、 manipulated 了什么、得到什么数字。数字就是答案里的 Evidence。
3. **Every criticism needs two halves.** 评价 = *哪里有问题* + *为什么这是个问题*。只写前半句只拿一半分。
4. **Check the answer key, correct in pen, then do the brain dump page from memory.** 对答案 → 用笔订正 → 合上笔记自测。

What this topic covers 内容地图

Syllabus 考纲	Content 内容	Workbook pages
6.1.4	term eyewitness testimony · factor post-event information · stress and trauma · weapon focus · other-race effect	pp. 2–15
Key studies 关键研究	evid Gabbert · Poole & Lindsay · Yuille & Cutshall · Crombag · Morgan · Valentine & Mesout · Loftus · Maass & Köhnken · Pickel · Meissner & Brigham	throughout
Exam skills 考试	exam IDEA for scenario questions · 8-mark evaluate plan · sentence templates	pp. 16–19
Self-test 自测	Brain dump from memory · answer key	pp. 20–22

The one-line map of the whole topic 全章一句话

Eyewitness memory is honest but not always accurate — four factors damage it at two moments in time:
① **post-event information** 在*事后*改写记忆：讨论、提问、媒体报道混进原始记忆。
② **stress and trauma**、③ **weapon focus**、④ **other-race effect** 都在*看的时候*动手：压力太大、注意力被武器吸走、外族面孔编码不准——信息从一开始就没存好。

Review tracker 复习打卡

- ☐ Four factors placed on the timeline 四个因素按时间轴归类 Date: _____
- ☐ Key numbers written from memory 关键数字默写（71% · 60% · 95% · 84% · 11% vs 39% · 1.40×） Date: _____
- ☐ Pickel's 2×2 matrix filled from memory Pickel 矩阵默填 Date: _____
- ☐ 8-mark essay written with evidence on both sides 双边证据的 8 分题写完 Date: _____
- ☐ Brain dump done with the book closed 合上笔记完成自测 Date: _____

§1 · Foundations — eyewitnesses and the problem · 基础定位

ANSWERS → 课件 §1–§3

Key terms 术语填空 — learn word for word 一字不差地背

eyewitness（目击证人）	An individual who _____, such as a crime, occurring.（sees an event 亲眼看见事件发生）
eyewitness testimony（目击证人证词）	The _____ an eyewitness gives of what they saw, usually to the police and later in court.（account 陈述）

Why eyewitnesses matter 为什么目击证人重要

- Eyewitness testimony is the _____ form of evidence in criminal trials — and juries find it very convincing.（most common 最常见）
- Incorrect eyewitness accounts are the _____ cause of miscarriages of justice（司法误判）.（leading 首要）
- The witness is _____ — but the memory itself may be wrong.（honest and confident 诚实且自信）

The one-sentence distinction 一句话分清

诚实 ≠ 准确。 A witness never lies; the memory itself gets damaged. This whole topic is about the *four ways* it gets damaged — not about lying witnesses.

The tool that protects memory 保护记忆的工具

The **cognitive interview**（认知访谈）uses _____ questions precisely because leading questions can contaminate memory.（open, non-leading 开放式、不带引导） Everything in this chapter explains *why* that technique matters.

The four factors on a timeline 时间轴上的四个因素

Factor 因素	When 何时	The damage it does 怎么弄坏记忆
Post-event information（事件后信息）	_____（after 事后）	New information reaches the witness and gets mixed into — or overwrites — the original memory.
Stress and trauma（压力与创伤）	_____（during 事发时）	High arousal narrows what gets encoded; memory feels vivid but details were never stored.
Weapon focus（武器聚焦）	_____（during 事发时）	Attention locks onto the weapon; the face is missed.
Other-race effect（异族效应）	_____（during 事发时）	Same-race faces are recognised more accurately than other-race faces.

The first exam move 考场第一步

给一个场景，先问：**问题出在"看的时候"还是"看之后"?** 答案"看之后" → post-event information；"看的时候" → 再从另外三个里挑。这一步直接把选项从 4 个砍到 1–3 个。

§2 · factor Factor 1 · Post-event Information — the concept

ANSWERS → 课件 §4

Key terms 术语填空

post-event information（事件后信息）	Any information _____ the witnessed event which may _____ the original memory of the incident.（after · influence 事后 · 影响）
leading question（引导性问题）	A question that _____ the answer it wants, e.g. "How tall was the person?" implies the person was tall.（suggests 暗示）
schema（图式）	A mental framework of _____ about what usually happens in an event.（expectations 预期）

Where post-event information comes from 三个来源

1. **Talking to other witnesses** — discussions before the police interview.
2. **Being questioned** by police or lawyers — leading questions, sometimes unintentional, sometimes used deliberately in court.
3. **Watching** _____ — especially if the case is high-profile.（media coverage 媒体报道）

It matters because witnesses are interviewed over a period of time and a case can take **a long time before it reaches court** — what fills that gap changes what the witness remembers.

The mechanism: reconstructive memory 机制：重构记忆

How memory actually works 记忆的真实工作方式

We do not replay memories like video. **Reconstructive memory（重构记忆）** means we _____ the scene using the main points and our interpretation, influenced by our cultural norms and expectations.（rebuild 重建） Because the memory is already a reconstruction, new details from after the event _____ right in.（slot 无缝插入）

The name of the outcome 结果的名字

misinformation effect（错误信息效应） — memory becomes _____ because of exposure to post-event information.（less accurate 变得不准确） Pioneered by **Elizabeth Loftus** since the 1970s.

类比：记忆不像硬盘里的录像文件，更像一篇每次重讲都会改写的作文。朋友说"那人戴了帽子吧？"——下次回忆时"帽子"就真的出现在你的画面里了。不是撒谎，是作文被补写了一笔。

The chain in one line 一条链记住

事后信息到达 → 记忆本来就是重建的 → 新细节混入或改写原文 → recall 的时候错误细节和真细节**同样生动、同样自信**。

§3 · evid Factor 1 · Laboratory Evidence

ANSWERS → 课件 §5

Study 1 · Gabbert, Memon and Allen (2003) — memory conformity 记忆从众

Who 被试	What happened 过程	Numbers 数字
_____ **students** (120)	Watched a video of a girl returning a book to a university office — in **pairs**, and each partner saw a _____ version: one saw the book returned; the other saw the girl _____ it. (slightly different · stealing 略不同 · 偷书) One condition recalled without discussion; the other _____ first. (discussed 讨论)	_____ **%** of witnesses who discussed recalled items that were **not in their own video**. _____ **%** said the girl was guilty although their own version showed no theft. (71 · 60)

妙处：两位"目击者"看的是**不同的视频**——所以讨论后说出对方视频里的细节，就能证明信息来自讨论，不是来自记忆。这叫 **memory conformity**：讨论让证词变得像一个模子刻出来的。

Study 2 · Poole and Lindsay (1995) — children and leading questions

Who 被试	What happened 过程	Numbers 数字
Children aged _____ **and** _____ (3–4 · 5–7)	Took part in a science activity with **Mr Science**; first interview with no misinformation — generally accurate. _____ **later**, parents read them a story about Mr Science that included _____ activities the child never did; then a second interview with misleading questions. (Three months · two 三个月后 · 两个)	_____ **%** answered at least one leading question incorrectly about an activity they had _____. (95 · not experienced 没经历过)

They could not distinguish what they *experienced* from what they were *read in the story*. Children are **highly suggestible**（易受暗示的）when post-event information arrives as leading questions.

The reading habit 读研究的习惯

每个实验只记三样：**谁 · 改了什么 · 数字**。Gabbert 记 **71% / 60%**，Poole & Lindsay 记 **95%**。写答案时数字就是你的 Evidence。

Self-check 自查

- ☐ I can explain *why two different videos* makes Gabbert's conclusion so convincing.
- ☐ I can state both numbers for Gabbert and the one number for Poole and Lindsay.
- ☐ I can define memory conformity without looking.

§4 · evid Factor 1 · Real-life Evidence

ANSWERS → 课件 §6

Laboratory findings look scary. But witnesses of **real crimes** sometimes hold up much better — that contradiction is exactly what an evaluation question wants from you.

Study 3 · Yuille and Cutshall (1986) — a real shooting

- Case study of a real _____ in Canada. (shop robbery and shooting 商店抢劫与枪击)
- Real witnesses interviewed; accounts compared with _____. (police records 警方记录)
- Witnesses had **detailed memories** and were **not misled** by two leading questions — a "busted _____" (it was not broken) and a "yellow _____" (it was blue). (headlight · quarter panel 车头灯 · 车身板)

Study 4 · Odinot (2008) — a real supermarket robbery

- _____ **employees** of a Dutch supermarket interviewed _____ after two armed robbers hit the safe. (28 · three months 三个月)
- Compared with _____ footage, _____% of remembered information was accurate. (CCTV · 84)
- Many had watched a _____ five weeks later, containing errors — yet it **did not alter** their memories. (televised reconstruction 电视重建画面)

But read the small print 细节也很重要

- Yuille and Cutshall used only a _____ of witnesses. (small sample 小样本)
- Odinot's witnesses likely _____ any errors from the TV reconstruction during discussions at work — so the misinformation may simply never have survived. (reconciled 互相核对纠正)

Two lines side by side 两条线并排记

Setting 场景	Result 结果
Laboratory 实验室（Gabbert、Poole & Lindsay）	Post-event information **does** contaminate memory（71%、95%）.
Real crimes 真实案件（Yuille & Cutshall、Odinot）	Witnesses **resisted** — not misled; 84% accurate.

大概率都对——区别在场景：实验室里看视频不紧张、不投入；真实罪案里证人亲眼在场，记得牢。**真实世界生态效度高，实验室控制好**——这就是下一页评价的核心。

§5 · eval Evaluating Factor 1 · Post-event Information

ANSWERS → 课件 §7

The rule for every evaluation point 评价点的写法规则

Point = what + why it matters. 先说"哪里有问题"，再给一句"为什么这是个问题"。只写前半句，大题只能拿一半分。

Two strengths 两点支持

Strength	What it says 内容	Why it matters 为什么算支持
A large body of research	Loftus's **misinformation effect**: many studies show post-event information _____ eyewitness memory.（influences 影响）	Many separate studies point the _____ way.（same 相同）
It explains real harm	False convictions have been traced to contaminated memory; if leading questions are detected, testimony can be ruled _____.（inadmissible 不予采信）	The _____ is a direct fix built on this research.（cognitive interview 认知访谈）

Two criticisms 两点批评

Criticism	What it says 内容	Why it matters 为什么是个问题
Laboratory vs real life（**ecological validity** 生态效度）	Lab studies yield _____ results from real-life witnesses; lab experiments minimise _____ — participants know the crime is not real.（different · emotional stress 不同 · 情绪压力）	The lab may _____ how fragile real memories are — real witnesses (Yuille and Cutshall; Odinot) resisted contamination.（overstate 夸大）
Ethical issues（伦理问题）	Research may involve exposing participants to a _____ or distressing footage; questioning real witnesses forces them to _____.（traumatic event · relive the incident 创伤事件 · 重历事件）	_____ from psychological harm limits what researchers are allowed to do.（Protection 保护）

Write it out · 写一条完整评价（3 行）

Weakness: laboratory studies of post-event information lack ecological validity. In lab experiments…

Sentence pattern · 可套用的句式

- **Strength:** "A strength is that a large body of research supports the effect; for example, Gabbert et al. (2003) found 71%… This matters because many separate studies point the same way."
- **Weakness:** "A limitation is ecological validity; in laboratory studies participants know the crime is not real. This matters because the lab may overstate how fragile real memories are — Odinot's witnesses stayed 84% accurate."

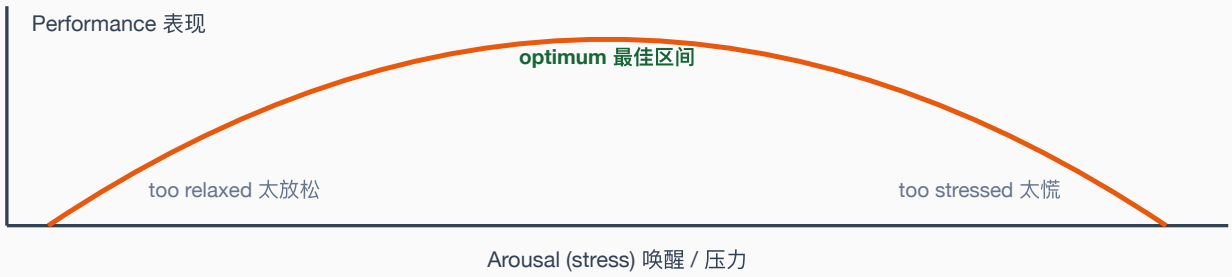

§6 · factor Factor 2 · Stress and Trauma — the concept

ANSWERS → 课件 §8

Key terms 术语填空

arousal （唤醒）	The level of _____ and psychological alertness a person is experiencing, from sleepy to highly stressed.（physiological 生理的）
Yerkes–Dodson Law （耶克斯–多德森定律）	Performance increases with arousal up to an _____ point, then _____ as arousal gets too high.（optimum · declines 最佳 · 下降）

The curve 曲线（默画）

In the space above the curve, sketch the inverted-U yourself from memory, then compare. 记忆口诀：**a little stress helps, too much wrecks performance**（一点压力帮忙，压力太大砸锅）。太放松也不行——有一个最佳唤醒区间，而且很容易越过它。

Three mechanisms 三个机制

Mechanism	What it says 内容
① **Yerkes–Dodson Law**	Optimum arousal exists; a very stressful event pushes arousal _____ the optimum, and recall of the incident is _____.（past · impaired 越过 · 受损）
② **Attentional narrowing** （注意狭窄）	_____ hypothesis (1959): under high emotional arousal, attention _____ — the witness focuses on fewer details and does not encode the rest.（Easterbrook · narrows 变窄）
③ **Source monitoring** （来源监控）	Traumatic events get rehearsed (statements, media, conversations); people may _____ information encoded after the event with what actually happened, because they fail to distinguish the _____.（confuse · source 混淆 · 来源）

The trap 主观感觉的陷阱

证人往往觉得自己记忆栩栩如生（vivid memory），但压力恰恰**损害了编码**——信息可能从一开始就没存进去。**感觉越真实，越要警惕。**

§7 · evid Factor 2 · Stress Evidence

ANSWERS → 课件 §8–§9

The classic demonstration · Crombag et al. (1996) — the phantom footage 幻影电视画面

> *A Boeing 747 crashed into apartment buildings in Amsterdam. Soon afterwards, researchers asked people:* ***did you see the television footage of the moment of impact?*** *— but* ***no such footage exists****.*

- _____% of participants claimed to have seen the footage.（60）
- They were not lying — traumatic memories are especially open to post-event contamination, and _____ completely failed.（source monitoring 来源监控）

Lab and field: stress impairs recall 压力损害记忆的证据

Study	Findings 发现
Morgan III et al. (2004)	_____ people in survival training: high-stress vs low-stress interrogation over 30 minutes; a **large number** in the high-stress condition could not identify their interrogator.（509）
Morgan III et al. (2007)	_____ personnel under acute interrogation stress: _____ incorrectly identified their interrogator _____ hours later.（53 · 1 in 3 · 48）
Valentine and Mesout (2009)	London Dungeon: visitors genuinely stressed by the horror attraction and did _____ they would be asked to recall — identification was _____ by arousal.（not know · impaired 不知道 · 受损）
Deffenbacher et al. (2004)	_____: across the whole research base, stress has **more of a negative** impact than a positive one — true for identification *and* recall of event details.（meta-analysis 元分析）

Real life: memory sometimes holds up 真实世界：记忆有时完好

Study	Findings 发现
Thompson et al. (1997)	Survivors of the *Marchioness* ferry sinking: _____ **out of** _____ statements confirmed as accurate.（74 · 86）
Rinolo et al. (2003)	*Titanic* survivors: _____ **out of** _____ reported the ship breaking apart on the surface — consistent with _____ evidence.（15 · 20 · forensic 法医）
Yuille and Cutshall (1986)	Witnesses who reported _____ stress recalled with **greater accuracy** — but the catch: they were also _____ to the incident.（high · closest 最近）

The evaluation gem 高级评价点

为什么结果不一致？—— 有的研究里的唤醒来自**焦虑和恐惧**（像真目击者），有的只来自**警觉和注意**（实验室条件）。**"arousal"在不同研究里含义不同，所以比较研究很困难。**这句话写进大题就是高级评价点。

§8 · eval Evaluating Factor 2 · Stress and Trauma

ANSWERS → 课件 §10

Two strengths 两点支持

Strength	What it says 内容	Why it matters 为什么算支持
The meta-analysis settles it	Deffenbacher et al. (2004): across the whole research base, stress _____ both identification and recall.（impairs 损害）	_____ separate studies point the same way.（Many 许多）
Some studies capture real stress	Valentine and Mesout's participants did not know they would be tested; Morgan's faced genuinely stressful interrogations.	The evidence is not just a _____ imitation of stress.（classroom 课堂式的）

Two criticisms 两点批评

Criticism	What it says 内容	Why it matters 为什么是个问题
Laboratory arousal ≠ eyewitness arousal（**validity 效度**）	Lab studies may not reach the _____ level of arousal — the artificial setting produces _____; arousal could mean anxiety or fear, or simply heightened _____.（critical · under-arousal · alertness 临界 · 唤醒不足 · 警觉）	The experiments may measure the _____ thing entirely.（wrong 错的）
Real-life studies contradict the lab — and each other（**contradictory findings 结论互相矛盾**）	Thompson (74/86), Rinolo (15/20) and Yuille and Cutshall (high stress = more accurate) clash with Morgan and Deffenbacher; and Y&C's most stressed witnesses were also the _____ — stress tangled up with _____.（closest · viewing distance 最近 · 观察距离）	A factor that helps in one study and harms in another has not yet been _____.（pinned down 确定下来）

Practical issues in research 研究设计的两难

The Yerkes–Dodson curve warns researchers: lab participants may sit in the _____ flat part of the curve while a real witness sits past the peak.（under-aroused 唤醒不足的） You cannot _____ create a genuine trauma in a laboratory — so the most controlled studies are the least true to life.（ethically 伦理上） This trade-off reappears in every factor of the chapter.

Write it out · 写一条完整评价（3 行）

Weakness: the meaning of "arousal" differs between studies. In laboratory experiments…

§9 · factor Factor 3 · Weapon Focus — the concept

ANSWERS → 课件 §11–§12

Key term 术语填空 — learn word for word

weapon focus（武器聚焦）: an eyewitness's _____ on a weapon to the _____ of other details of a crime.（concentration · exclusion 注意集中 · 排除）

Two possible explanations 两条路线（考试要求都能说出名字）

Route	The mechanism 机制
Route 1 · the stress route（压力路线）	The weapon frightens you → arousal shoots past the _____ optimum → encoding is _____.（Yerkes–Dodson · impaired 受损）
Route 2 · the attention route（注意路线）	Attention _____ onto the weapon itself; other important details are _____ encoded. Not stress — a focus of attention.（narrows · never 变窄 · 从未）

两条路线结果相同：**the weapon is remembered, the face is not**。区别是考点：路线 1 说"因为吓"，路线 2 说"因为只顾看"。

Study 1 · Loftus et al. (1987) — the eye-tracking experiment

- _____ **participants** watched slides of a customer in a restaurant; one version _____, the other held a _____.（36 · armed · chequebook 持枪 · 支票簿）
- Eye movements were _____: weapon-viewers **tended to focus their gaze on the weapon**.（recorded 记录）
- They were less likely to identify the customer in an identity parade: _____**% vs** _____**%**, and had a worse memory for the event.（11 · 39）

Study 2 · Maass and Köhnken (1989) — the field experiment

- _____ **students** approached by a woman holding either a _____ or a _____.（86 · pen · syringe 钢笔 · 注射器）
- _____ of the syringe condition made an _____ identification — supporting the weapon effect in a more real-life situation.（Two-thirds · incorrect 三分之二 · 错误）

Method note 方法小注

Loftus 用**眼动仪**直接看到"眼睛去了哪"（实验室控制）；Maass & Köhnken 用**真实接触**（现场实验）。两种方法指向同一结论 —— 这本身就是评价里的一条 strength。

§10 · evid Pickel (1998) — threat or unusualness?

ANSWERS → 课件 §12

The study 研究设计

- Video of a _____: a man walks up to the receptionist and hands her money. Only the _____ changes. (hair salon · object in his hand 美发沙龙 · 手里的东西)
- Participants completed a _____-minute filler task, then answered recall questions. (10)
- Found: _____ and _____ produced the **poorest recall**; the _____ and _____ had less effect. (weapon · raw chicken · wallet · scissors 武器 · 生鸡肉 · 钱包 · 剪刀)

The 2×2 matrix — fill every cell 2×2 矩阵默填

	Low threat 低威胁	High threat 高威胁
Low unusualness 不奇怪	_____ (wallet — recall was better 钱包，回忆更好)	_____ (scissors — recall was better (normal in a salon!) 剪刀，回忆更好)
High unusualness 很奇怪	_____ (raw chicken — poorest recall 生鸡肉，回忆最差)	_____ (weapon — poorest recall (both threatening *and* unusual) 武器，回忆最差)

Pickel's conclusion 结论（考试采分句）

It is the _____ of an object that draws attention — *not* the threat. (unusualness 奇怪程度) In a salon scissors are normal; a weapon and raw chicken are bizarre. 纵轴"奇不奇怪"，横轴"吓不吓人"——伤记忆的是**奇怪的那两个**。

Pickel et al. (2006) — can training overcome it? 训练能克服吗?

- Participants watched a staged scene, first hearing a lecture: (a) about _____ — attend to perpetrator features; or (b) about eyewitness _____ (neutral). (weapon focus · confidence 自信)
- A man then burst in carrying a _____ or a _____. (book · weapon 书 · 武器)
- Lecture (b) group: the weapon produced fewer correct details. Lecture (a) group: _____ — object type had no effect. (protected 被保护了)
- Conclusion: with proper instruction, the weapon-focus effect could be _____. (overcome 克服)

Think-write · 想一想（3 行）

Why does the raw chicken result matter so much? What would Pickel's conclusion have been if only the weapon (not the chicken) had damaged recall?

§11 · eval Evaluating Factor 3 · Weapon Focus

ANSWERS → 课件 §13

Two strengths 两点支持

Strength	What it says 内容	Why it matters 为什么算支持
Multiple methods agree	Lab eye-tracking (_____), field approach (_____) and simulation (_____) all show poorer identification or recall.（Loftus 1987 · Maass & Köhnken 1989 · Pickel 1998）	The effect survives changes of _____.（method 方法）
The meta-analysis confirms it	_____ et al. (2013): weapon presence consistently shows a negative effect on both _____ accuracy and _____ accuracy — controlled conditions *and* real life.（Fawcett · feature · identification 细节 · 辨认）	The strongest form of support — a whole _____ of research.（body 体系）

Two criticisms 两点批评

Criticism	What it says 内容	Why it matters 为什么是个问题
Real police data found no effect	_____ et al. (2003) coded **real police interviews** of robbery and assault witnesses and found _____ evidence of any effect of weapon presence on feature accuracy.（Wagstaff · no 无）	The laboratory effect may simply not _____ in real crimes.（appear 出现）
Lab slides are not real crimes（**artificiality** 人工性）	Slides do not emulate really seeing a weapon; Fawcett notes real-world research is complicated by factors labs control — such as _____.（exposure to the weapon 看到武器的时长）	A slide of a weapon is not a _____ to you.（threat 威胁）

Wider issue: psychology in society 知识的社会应用

Pickel's studies suggest courts should carefully consider the reliability of an eyewitness when the crime involved a _____ — and the effect can be _____ (Pickel 2006). Particular application to _____, who routinely face these situations: training could improve their recall when a weapon was present.（weapon · overcome · police officers 武器 · 克服 · 警察）

Exam tip 写作要点（课本原文）

Using a number of studies to evaluate a topic, it is **not always necessary to describe every stage of each study in detail**. The emphasis is on showing your _____ of the studies and using that to _____ whether they support the topic.（understanding · evaluate 理解 · 评价）

§12 · factor Factor 4 · The Other-race Effect — the concept

ANSWERS → 课件 §14

Key terms 术语填空

other-race effect （异族效应）	_____-race faces are recognised more _____ than faces of a different race.（same · accurately 本族 · 更准） Also called the cross-race effect.
in-group （内群体）	A group to which we _____ membership.（have 拥有）
out-group （外群体）	A group to which we _____ have membership.（do not 不）

The case that defines the issue 界定这个问题的案件

Ronald Cotton (1984)

- Jennifer Thompson, a white woman, was assaulted; despite considerable effort to _____ the face of the Black assailant, she _____ Ronald Cotton.（remember · misidentified 记住 · 认错）
- He was convicted and spent _____ in prison before being exonerated by _____ evidence.（more than ten years · DNA 十多年）
- Thompson was a **motivated, honest** witness who tried her hardest. She was **still wrong**.

Two explanations 两个解释

Explanation	What it says 内容	The problem 问题
① Encoding differences （编码差异） **(Valentine (1991))**	We encode faces by attending to features that discriminate _____ faces of our own race; we are experienced at own-race features but not other-race ones.（between 在…之间）	Fails to explain why the effect occurs even in people with _____ exposure to other-race faces.（high 高）
② In-group / out-group processing （内外群体加工）	_____-group faces are processed as individuals — discriminated one from another; _____-group faces are only processed to categorise them.（In · out 内 · 外）	Prediction: own-race faces are encoded _____ better.（qualitatively 质上）

One sentence to tell them apart 一句话区分

解释 ① 说"**练习问题**"——你练的是分辨本族面孔的能力；解释 ② 说"**归类问题**"——你把外族人脸当成"一类"，把本族人脸当成"一个人"。

The evidence 证据（填关键数字）

Study	Key finding 关键发现
Scheck, Neufeld and Dwyer (2000)	_____ mistaken eyewitness identifications: _____% were white victim witnesses misidentifying Black suspects.（77 · 35）
Smith (2004)	_____ white participants watched staged theft footage: more accurate identifying the white thief — and more _____ about it. Confidence and accuracy move together only for own-race faces.（161 · confident 自信）
Brigham et al. (1982)	Field study, convenience store cashiers: only a _____ own-race effect — but recognition of the Black customer related to self-reported _____.（small · cross-racial experiences 跨种族接触经历）
Platz and Hosch (1988)	Replication: the effect extended to identification of _____ customers too.（Hispanic 拉美裔）
Hourihan et al. (2012)	_____ participants (white 50, Asian 52): white participants superior at recognising white and East Asian faces — possibly due to _____ exposure.（102 · media 媒体）
Hancock and Rhodes (2008)	Higher _____ with other-race groups was associated with increased other-race facial recognition — _____ reduces the effect.（contact · exposure 接触 · 接触）
Sangrigoli et al. (2005)	Adult _____ adopted by European white families as children were better at identifying white faces — _____ childhood exposure can reduce own-race bias.（Koreans · early 韩裔 · 早期）
Meissner and Brigham (2001)	_____ of 39 cross-race identification articles: own-race faces were _____ times more likely to be correctly identified and _____ times less likely to be falsely identified.（meta-analysis · 1.40 · 1.56）

Evaluation 评价

Point	What + why 内容 + 为什么
Strength: converging methods	Archival data (Scheck) + field studies (Brigham; Platz & Hosch) + lab tests (Hourihan; Smith) + natural experiment (Sangrigoli) + meta-analysis all point the same way — _____ support.（unusually strong 异常强的）
Strength: the experience finding is useful	Brigham, Hancock & Rhodes, Sangrigoli all suggest _____ with other-race faces improves recognition — the effect is **not fixed**.（experience 接触经验）
Weakness: ecological validity	Much research uses _____ of faces in laboratory settings, not real witnesses — recognising a photo and identifying a criminal are _____ tasks.（isolated photographs · not the same 孤立照片 · 不是同一件事）
Weakness: confidence ≠ accuracy	Smith (2004): confidence was higher for own-race identification. Juries are swayed by _____ — but a confident witness of an other-race perpetrator may be precisely the _____ reliable one.（confidence · least 自信 · 最不）

The four factors, closed out 四因素收口

post-event information（事后的信息改写记忆）→ stress & trauma（当时的唤醒让编码变窄）→ weapon focus（注意被武器吸走）→ other-race effect（外族面孔编码不足）。**前三个都有"实验室说有害、真实世界说未必"的拉扯；第四个是四种方法指向同一结论。**评价里能指出"每个因素的证据强弱不同"，已经是高分答案。

§14 · exam Exam Skills — how answers are marked

ANSWERS → 课件 §17

IDEA — 回答带情境的题目

- **I — Identify:** which factor is the scenario showing? First check the **timeline** — while watching, or afterwards?
- **E — Explain:** state the factor and its mechanism in its own terms.
- **A — Apply:** tie it to the **details** — name the object, the person, the timing.

A sentence that says *what* earns one mark; the same sentence plus *why it matters* earns two. 只复述因素、不碰情境细节，写得再标准也是一半分。

The big question 8 分大题怎么拆

- **Half the marks for accurate content, half for judgement with evidence.** Four paragraphs: importance → evidence of unreliability → evidence of reliability → conclusion.
- **A generic answer scores nothing.** 写"记忆有时好有时坏"这类没接触证据的空话，永远停在中档。

The 8-mark plan 提纲（先填这里，p.18 写全文）

¶	What goes in it 内容	My notes 我的要点
1	**Why EWT matters:** most common evidence, trusted by juries — yet incorrect eyewitness accounts are the leading cause of miscarriages of justice.	
2	**Unreliable:** post-event information (Gabbert 71%), stress (Morgan 1 in 3; Deffenbacher meta), weapon focus (Loftus 11% vs 39%; Fawcett meta), other-race effect (Meissner & Brigham 1.40×).	
3	**Reliable:** real witnesses not misled (Yuille & Cutshall), accurate after trauma (Thompson 74/86; Rinolo 15/20; Odinot 84%), effect overcome (Pickel 2006), lab lacks real stress (ecological validity).	
4	**Conclusion** answering the question: reliability is *conditional* — on the factor, the stressfulness, the witness's experience. Confidence ≠ accuracy.	

Sentence templates · 考试句式（填空后就能用）

- **Definition:** "_____ is an eyewitness's concentration on a weapon to the exclusion of other details of a crime."（Weapon focus）
- **Mechanism + evidence:** "The presence of a weapon narrows attention onto the weapon itself, so the face is never encoded; Loftus et al. (1987) found only 11% of weapon-viewers identified the customer, versus 39%."
- **Evidence point:** "_____ found that _____ , which suggests _____ ."（study + number + conclusion）
- **Evaluation:** "A limitation is _____; in this study _____ . This matters because _____ ."
- **Conclusion:** "Overall, eyewitness testimony is _____ reliable, because _____ ."

§15 · evid Every number on one page 全部数字一页收口

Cover the right column and test yourself

Study	Factor 因素	The number 数字
Gabbert, Memon & Allen (2003)	post-event information	_____ (120 students · 71% recalled items not in their video · 60% said guilty)
Poole & Lindsay (1995)	post-event information	_____ (children 3–7 · 95% answered at least one leading question wrongly)
Crombag et al. (1996)	stress / source monitoring	_____ (60% claimed to see footage that never existed)
Morgan III et al. (2007)	stress	_____ (1 in 3 misidentified the interrogator 48 hours later (53 personnel))
Thompson et al. (1997)	stress — real life	_____ (74 of 86 Marchioness statements accurate)
Rinolo et al. (2003)	stress — real life	_____ (15 of 20 Titanic survivor statements consistent with forensic evidence)
Odinot (2008)	post-event — real life	_____ (84% of recall accurate (28 employees, 3 months, CCTV))
Loftus et al. (1987)	weapon focus	_____ (11% vs 39% identification (36 participants, eye-tracking))
Maass & Köhnken (1989)	weapon focus	_____ (two-thirds wrong identification in the syringe condition (86 students))
Scheck, Neufeld & Dwyer (2000)	other-race effect	_____ (35% of 77 mistaken IDs were white victims misidentifying Black suspects)
Meissner & Brigham (2001)	other-race effect	_____ (own-race faces 1.40× more likely correct, 1.56× less likely false (39 articles))

How to use numbers in an answer 答案里怎么用数字

一句顶三句：**study + number + conclusion**。例："Gabbert et al. (2003) found 71% of witnesses who discussed recalled items not in their own video, which suggests discussion can contaminate testimony long before it reaches court." 数字不用多，**每个因素记住一个**就够写满一段。

§16 · exam Practice A — short answers

Model answers → p.21

Q1 · 2 marks — ***Describe how stress may influence the reliability of eyewitness memory.***

Q2 · 1 mark — ***State what is meant by the term 'weapon focus' as a factor that influences eyewitness memory.***

Q3 · 1 mark — ***Define 'post-event information' as a factor that influences eyewitness memory.***

Q4 · 2 marks — ***Explain one reason why weapon focus may influence eyewitness memory.***

Q5 · 2 marks — ***Explain one ethical issue that should be considered when researching factors that influence eyewitness memory.***

Q6 · 6 marks — ***Evaluate the reliability of eyewitness testimony, using research evidence to support your answer. In your answer you should consider evidence for and against its reliability.***

(Plan three developed points here; the full 8-mark version is on p.18. 每点 = 内容 + 证据数字 + why it matters)

Before you write 动笔前先检查

☐ 每个 point 都有 study + number ☐ 每条评价都有 why it matters ☐ Q4/Q5 用了机制或术语原文

§17 · exam Practice B — the 8-mark essay

Model answer → p.22

Q7 · 8 marks — ***Evaluate the reliability of eyewitness testimony.***

(Half the marks for accurate content, half for judgement with evidence. Use the plan on p.15, then write four paragraphs.)

Write it up 写成答案

Self-mark 打分自测

Tick what you produced: ☐ four paragraphs ☐ at least four studies named ☐ numbers used as evidence ☐ both sides (unreliable + reliable) ☐ conclusion answers "how reliable" (not a repeat)

Score /8: _____ If 4 or below, re-write it in full from memory tomorrow.

§18 · term Key terms self-test 术语自测

Cover the definition column

Term 术语	Write the definition from memory 默写定义
eyewitness testimony 目击证人证词	
post-event information 事件后信息	
leading question 引导性问题	
reconstructive memory 重构记忆	
misinformation effect 错误信息效应	
memory conformity 记忆从众	
arousal 唤醒	
Yerkes–Dodson Law 耶克斯–多德森定律	
attentional narrowing 注意狭窄	
source monitoring 来源监控	
weapon focus 武器聚焦	
other-race effect 异族效应	
in-group / out-group 内群体 / 外群体	
ecological validity 生态效度	

The last three things to check before an exam 考前最后三件事

1. Can you place each of the **four factors** on the timeline (while watching vs afterwards)? 时间轴一步砍掉错误选项。
2. Do you have **one number per factor**? 每个因素一个数字，答案立刻有 Evidence。
3. Does every criticism you write carry a **why it matters** sentence? 没有 why 的评价只拿一半分。

§19 · Brain Dump — close the book · 合上笔记盲测

10 minutes · timer on

The honest self-test 自测说明

Close the workbook. Set a 10-minute timer. Without looking back, write everything you remember. Short phrases are fine — the lines you cannot fill are exactly the topics to revisit.

A · The four factors 四因素（定义 + 时机 + 一个研究数字）

post-event information	
stress and trauma	
weapon focus	
other-race effect	

B · Three mechanisms of stress 压力的三个机制

C · Pickel's 2×2 matrix from memory 矩阵默填（四格物品 + 结论）

D · Lab vs real life 实验室与真实世界的矛盾（各写两例 + 为什么）

Lab says harmful 实验室说有害	**Real life resists 真实世界说未必**

Self-mark 自评

- ☐ Wrote all **4 factors** with a study each — strong, go to past papers.
- ☐ Wrote 2–3 factors with numbers — one more pass on pp. 3–14.
- ☐ Wrote fewer — re-read pp. 3–14 first, then try again tomorrow.

p.2 — Foundations

eyewitness = **sees an event** occurring · testimony = the **account** given.
most common form of evidence; **leading** cause of miscarriages of justice; witnesses are **honest and confident**.
Cognitive interview: **open, non-leading** questions.
Timeline: post-event information = **after**; the other three = **during**.

p.3 — Factor 1 concept

post-event information = any information **after** the witnessed event which may **influence** the original memory.
leading question = **suggests** the answer it wants. schema = **expectations**.
Sources: other witnesses · police/lawyer questions · **media coverage**.
Reconstructive memory: **rebuild** the scene; new details **slot** right in.
misinformation effect = memory becomes **less accurate** (Loftus).

p.4 — Factor 1 lab evidence

Gabbert: **120** students; **slightly different** videos; **discussed** first; **71%** recalled items not in their own video; **60%** said guilty.
Poole & Lindsay: children **3–4** and **5–7**; **three months** later; **two** activities never done; **95%** answered at least one leading question wrongly; not experienced.

p.5 — Factor 1 real life

Yuille & Cutshall: **shop robbery and shooting**; compared with **police records**; "busted **headlight**", "yellow **quarter panel**".
Odinot: **28** employees; **three months**; **CCTV**; **84%** accurate; **televised reconstruction** did not alter memory.
Small print: **small sample**; witnesses **reconciled** errors.

p.6 — Factor 1 evaluation

Strengths: post-event information **influences** memory; studies point the **same** way. Testimony ruled **inadmissible**; the **cognitive interview** is the fix.
Criticisms: **different** results; minimises **emotional stress**; may **overstate** fragility. **Traumatic event**; **relive the incident**; **Protection** from harm.

p.7 — Factor 2 concept

arousal = **physiological** and psychological alertness.
Yerkes–Dodson = up to an **optimum** point, then **declines**.
① past the optimum → recall **impaired**. ② **Easterbrook** (1959) → attention **narrows**. ③ **confuse** post-event information with reality → fail to distinguish the **source**.

p.8 — Factor 2 evidence

Crombag: **60%**; source monitoring failed.
Morgan 2004: **509**. Morgan 2007: **53**; **1 in 3**; **48** hours.
Valentine & Mesout: **not know** they would be tested; identification **impaired**.
Deffenbacher: **meta-analysis**.
Thompson: **74** of **86**. Rinolo: **15** of **20**; **forensic**. Y&C: **high** stress; **closest** to the incident.

p.9 — Factor 2 evaluation

Strengths: stress **impairs**; **Many** studies; not a **classroom** imitation.
Criticisms: not the **critical** level; **under-arousal**; heightened **alertness**; measures the **wrong** thing. Y&C witnesses **closest**; tangled with **viewing distance**; not yet **pinned down**. Practical: lab sits in the **under-aroused** flat part; cannot **ethically** create trauma.

Answer Key · Part 2 — factor 3/4, exam models 答案速查（二）

Mark honestly, then re-write in full

pp.10–12 — Factor 3

weapon focus = **concentration** on a weapon to the **exclusion** of other details.
Route 1: past the **Yerkes–Dodson** optimum → encoding **impaired**. Route 2: attention **narrows**; details **never** encoded.
Loftus 1987: **36**; **armed** vs **chequebook**; eye movements **recorded**; **11% vs 39%**.
Maass & Köhnken: **86**; **pen** / **syringe**; **Two-thirds incorrect**.
Pickel 1998: **hair salon**; **object** changes; **10**-min filler; weapon + **raw chicken** poorest; **wallet** + **scissors** less effect. Conclusion: **unusualness** draws attention.
Pickel 2006: lecture (a) **weapon focus** vs (b) **confidence**; **book** / **weapon**; (a) group **protected**; effect **overcome**.
Eval: **Loftus 1987 / Maass & Köhnken 1989 / Pickel 1998**; effect survives changes of **method**; **Fawcett** 2013; **feature** + **identification**; whole **body** of research. **Wagstaff** 2003: **no** effect in real police interviews; may not **appear** in real crimes; **exposure to the weapon**; not a **threat** to you. Wider issue: **weapon**; **overcome**; **police officers**. Exam tip: show **understanding** then **evaluate**.

pp.13–14 — Factor 4

other-race effect = **same**-race faces recognised more **accurately**. in-group = **have** membership; out-group = **do not**.
Ronald Cotton: **remember** the face; **misidentified**; **more than ten years**; **DNA**.
① Valentine: discriminate **between** own-race faces; fails for **high** exposure. ② **In**-group individuated; **out**-group categorised; encoded **qualitatively** better.
Evidence: Scheck **77**, **35%**; Smith **161**, more **confident**; Brigham **small** effect, **cross-racial experiences**; Platz & Hosch **Hispanic**; Hourihan **102**, **media**; Hancock & Rhodes **contact/exposure**; Sangrigoli **Koreans**, **early**; Meissner & Brigham **meta-analysis**, **1.40×**, **1.56×**.
Eval: **unusually strong** support; **experience** improves recognition, not fixed; **isolated photographs**, **not the same** tasks; juries swayed by **confidence**, may be the **least** reliable.

p.15 — Sentence templates

Definition: **Weapon focus**. Evidence point: **study + number + conclusion**. Evaluation: **limitation + study detail + why it matters**. Conclusion: **conditionally reliable + because**.

p.16 — Key numbers

Gabbert: 120 · 71% · 60% — Poole & Lindsay: 95% — Crombag: 60% — Morgan 2007: 1 in 3 (48 h) — Thompson: 74/86 — Rinolo: 15/20 — Odinot: 84% — Loftus: 11% vs 39% — Maass & Köhnken: two-thirds — Scheck: 35% of 77 — Meissner & Brigham: 1.40× / 1.56×.

p.17 · Q1 — stress and reliability (2 marks)

Stress increases arousal; according to the **Yerkes–Dodson Law**, once arousal passes the optimum level, performance — including recall of an event — **declines**. Stress also **narrows attention** (Easterbrook, 1959): the witness encodes only central details and misses peripheral information, so testimony is incomplete even when it feels vivid.

p.17 · Q2 — weapon focus (1 mark)

Weapon focus is an eyewitness's concentration on a weapon to the **exclusion of other details** of a crime.

p.17 · Q3 — post-event information (1 mark)

Post-event information is **any information after the witnessed event** which may influence the **original memory** of the incident.

p.17 · Q4 — why weapon focus matters (2 marks)

The presence of a weapon **narrows the witness's attention** onto the weapon itself, so other important details — especially the perpetrator's face — are **never encoded**. Loftus et al. (1987) found only 11% of weapon-viewers identified the customer, versus 39% with a chequebook.

p.17 · Q5 — ethical issue (2 marks)

Research may involve **exposing participants to a traumatic event or distressing film footage**, risking **psychological harm**; questioning real witnesses forces them to **relive the incident**. Researchers must weigh the value of the findings against protection from harm.

p.18 · Q6/Q7 — evaluate the reliability of EWT (8 marks)

¶1 Importance. EWT is the most common form of evidence in court and juries find it convincing — yet incorrect eyewitness accounts are the leading cause of miscarriages of justice.
¶2 Unreliable. Memory is reconstructive, so post-event information alters it: Gabbert et al. (2003) — 71% of discussing witnesses recalled items not in their own video. Stress narrows encoding: Morgan III et al. (2007) — 1 in 3 misidentified their interrogator; Loftus et al. (1987) — 11% vs 39% identification. Meissner and Brigham (2001): own-race faces 1.40× more likely to be correctly identified.
¶3 Reliable. Real witnesses resist the lab predictions: Yuille and Cutshall (1986) — not misled; Thompson et al. (1997) — 74 of 86 statements accurate; Odinot (2008) — 84% accurate; Pickel et al. (2006) — training overcame weapon focus. Lab studies, lacking genuine stress, may overstate unreliability.
¶4 Conclusion. EWT is *conditionally* reliable: stress, weapons, post-event information and the other-race effect degrade it in controlled research, but real, close involvement often produces accurate memory. Courts should weigh the conditions — and treat confidence as separate from accuracy.
