What this workbook covers 本册讲什么

Real witnesses cannot legally be tested and real jurors cannot be studied at all. So crime research is **simulated**: film clips in labs, staged incidents in the field, and mock juries watching trial videos. This booklet walks through all three methods, how to evaluate them with the fixed vocabulary (reliability, validity, objectivity, generalisability, credibility), the BPS ethics and risk management rules, and the textbook exam questions.

How to use this booklet 怎么用

1. **Fill it in as you go** — check the answer key (last page) after each page.
2. **The comparison table (p.5) and the evaluation vocabulary (p.6–7) matter most.** Do them from memory, under time.

Content map 内容地图

Page	Topic	What you must be able to do afterwards
p.2	Lab experiments 实验室实验	Define it, state IV/DV in crime research, recite the three steps
p.3	Lab evaluation	Two strengths, two limitations, the reductionism debate
p.4	Field experiments 现场实验	Valentine and Mesout; field vs natural experiment
p.5	Mock juries + comparison	Why mock juries exist; compare all three methods
p.6–7	Evaluation vocabulary 评价词	Reliability, validity (3 studies), objectivity, generalisability, credibility
p.8	Ethics 伦理	BPS (2009), HCPC, protection, deception and consent, withdrawal, debrief
p.9	Risk management 风险	Risk assessment in field/lab/offender work; OASys
p.10	Data analysis + exam skills	List A and List B; the 8-mark design frame
p.11	Exam practice 真题	Textbook questions: 4+2+2+8 marks
p.12	Answer key + brain dump	Mark honestly, then rewrite wrong answers in full

Revision tracker 复习打卡

☐ p.2–3 lab ☐ p.4 field ☐ p.5 mock jury ☐ p.6–7 evaluation ☐ p.8–9 ethics & risk ☐ p.10–11 exam

The whole chapter in one sentence 一句话总结

Because testing real witnesses is illegal and real jurors cannot be studied, criminological psychology relies on **laboratory experiments** (control, cause and effect, but artificial), **field experiments** (realistic, but unreliable) and **mock jury studies** (access to verdicts, but role play without consequences), all of which must be judged on **reliability, validity, objectivity, generalisability, credibility and ethics** under the **BPS Code (2009)** and proper **risk management**.

Laboratory Experiments 实验室实验

Key term 关键术语

laboratory experiment（实验室实验）

Conducted in an **artificial environment** constructed by the experimenter; the researcher **manipulates the IV** and **measures the DV**.

Why labs? Why not real witnesses? 为什么要用实验室

It is _____ （illegal） to test real witnesses because it may _____ （bias their testimony）. So **participant witnesses** are tested in a simulated context, such as _____ （watching films in a laboratory）.

IV and DV in crime research

Role	In eyewitness research
IV（自变量）	A factor such as _____ （weapon presence） or _____ （leading question types）
DV（因变量）	The _____ （testimony provided） or the witness recall, often after watching a film

The Loftus three-step procedure 三步法（必背骨架）

Step	What happens	Where the IV can be introduced
1	_____ participants （gathering）	Vary participant _____ （characteristics: age, gender）
2	Show them a _____ or _____ of an incident or potential suspect （film; photographs）	Show different _____ （films, offences, suspects）
3	Ask them to _____ what they saw （recall）	_____ information: delay recall or change how they recall （post-event）

为什么三步法是答题骨架（中文理解）

任何「用实验室实验研究目击记忆」的题都按这三步写：**招人、看事件、测记忆**。IV 可以在任意一步动手：第一步换被试特征，第二步换刺激材料，第三步换回忆条件。8 分设计题就按这个顺序铺开。

Lab Experiments — Evaluation 实验室实验评价

Two strengths, two limitations 两条优点两条缺点

	Point	Consequence（必须写出后果）
Strength 1	_____ procedure （standardised）	Easier to _____ the experiment （replicate）
Strength 2	Precise control of _____ variables; events can be directly _____ （extraneous; manipulated）	A _____ relationship can be established （cause-and-effect）; impossible in a field setting where many variables act at once
Limitation 1	_____ of the setting produces unnatural behaviour （artificiality）	Low _____ （ecological validity）: participants expect to see something, pay attention, feel less stress, are not interviewed by police, and do not discuss what they saw
Limitation 2	Cannot _____ findings to a real-life setting （generalise）	Lab results may not match what research on a real accident would find

Wider issues and debates: reductionism 还原论

experimental reductionism（实验还原论）

Reducing complex behaviour to a _____ for the purpose of testing （single isolated variable）. Laboratory experiments do this: they isolate specific variables to measure their impact on a single DV.

Example: Ruva, McEvoy and Bryant (2007) isolated _____ to test its effect on verdicts （pre-trial publicity）, but did not research the many other variables influencing juries. Exploring single variables cannot capture mediating factors, so lab explanations are often _____ （incomplete）.

Ethics note 伦理提醒

Film clips of crimes would be _____ to experience in real life （unethical）. Watching a clip is less distressing than the real event, but may still upset a participant with _____ of a similar accident （previous experience）. They are given the _____ （right to withdraw）.

中文理解：控制换来的代价

两条优点和两条缺点是同一枚硬币的两面：**正因为控制得死，才换来因果结论；也正因为控制得死，行为才不真实、解释才不完整**。评价题把这对因果写出来，比各说各的强。

Field Experiments 现场实验

Key term 关键术语

field experiment（现场实验）

Like a lab experiment it manipulates an IV and measures a DV, but it is conducted in a _____ where the phenomenon would naturally occur （more natural setting）. The experiment is still _____ （artificially constructed）.

Same three steps, one change

A field experiment follows the same three steps as a lab experiment, but at step _____ the participants witness a _____ or _____ playing the role of an offender （2; simulated crime/event; an actor）.

Worked example: Valentine and Mesout (2009)

The **London Dungeon** study used _____ in the dungeons, its natural setting, to assess the effect of _____ on memory （real visitors; stress）. Visitors would not normally be asked to complete questionnaires or identify people they saw, but the setting itself was real.

Do not confuse 不要混淆

field experiment vs natural experiment（自然实验）

In a **natural experiment** the IV occurs _____, so the researcher does _____ manipulate it （naturally; not have to）. In a **field experiment** the researcher still _____ the IV （stages and manipulates）.

Evaluation 评价

	Point	Consequence
Strength 1	Participants experience the conditions of a _____ witness （real）: stress, discussing with others, not forewarned	Increases _____; findings representative of real situations （ecological validity）
Strength 2	Participants may be _____ they are in a study （unaware）	_____ minimised; responses genuine （demand characteristics）
Limitation 1	Many _____ variables in natural settings, e.g. distractions from other witnesses （situational）	Hard to replicate exactly; results inconsistent; low _____ （reliability）. Exception: some field studies can control variables, e.g. a staged bank robbery inside a bank
Limitation 2	Participants believe the incident is _____ （real）	More likely to experience _____ than in a lab; researcher must weigh the nature of the staged incident （distress）

中文理解：真实与失控是一对

现场实验和实验室实验正好反过来：**越真实，越失控**。真实带来生态效度和真心反应，失控带来重复困难和信度下降。这对比较是 6.3 最常考的评价角度。

Mock Jury Studies 模拟陪审团 + Three Methods Compared

Why mock juries exist 为什么需要模拟陪审团

- It is _____ to study genuine jurors as they sit through a trial or deliberate （not permissible）.
- Jurors are not permitted to _____ about what happened in the deliberation room after the trial （talk）.

Key term 关键术语

mock jury（模拟陪审团）

Real juries are members of the public _____ selected to sit through a trial and reach a verdict （randomly）.

Mock juries are experiments which try to _____ aspects of a real juror experience （emulate）.

What a mock jury study looks like

Essentially _____ experiments where participants are exposed to trial evidence through _____ or _____ （laboratory; video recordings; transcripts）. They are a _____ of the real juror experience （simulation）. Participants give a _____ or other information such as strength of the case or witness confidence （verdict）. Example: _____ （Ruva, McEvoy and Bryant (2007)）.

Evaluation of mock juries 评价

	Point and consequence
Strength	_____ control over exposure （good）: standardised procedures, same video or transcript except the manipulated variable, so _____ conclusions can be drawn （cause-and-effect）
Limitation 1	Simulation _____ varies （fidelity）: reading proceedings is weak; video with opening statements, witness accounts, cross-examination and judge's instructions is better. Many studies _____ deliberation, arguably the most important aspect; where it happens, time is _____ and the jury is smaller than _____ （skip; restricted; 12）
Limitation 2	_____ real consequences: verdicts may be less considered or cautious; jurors know they are _____ （no; role playing）
Limitation 3	_____ samples: younger and educated, unlike real juries （student）; but the impact is _____ （debated）
Counter	_____ et al. (2005) meta-analysis: race may influence real jurors in the _____ way as mock jurors （Mitchell; same）

Three methods compared 三方法对照表（考点索引）

Method	Reliability	Validity	Generalisability	Ethics
Lab	_____: standardised, replicable （high）	_____: artificial, low stress （doubtful）	Weak: may not transfer to real accidents	Artificial event protects; offer withdrawal
Field	_____: situational variables （low）	_____: genuine conditions （strong）	Strong: representative	Distress must be weighed
Mock jury	_____ on exposure （high）	_____: fidelity varies, role play （mixed）	Doubtful: student samples (debated)	Like lab; deception needs debrief

Evaluating Research 1 — Reliability and Validity 信度与效度

Reliability（信度）：consistency of findings

Method	Why
Lab experiments	_____ reliability: controlled design prevents other factors affecting the study; same film clip, specific age group; replication possible many times （high）
Field experiments	_____ reliability: situational variables occur in natural settings; exact replication difficult; findings inconsistent （lower）
Case studies	Hard to control participant and situational variables: difficult to find _____ （two identical people who experienced the exact same situation）

Validity（效度）：measuring what it claims to measure

Doubt about lab experiments and mock jury studies: participants may be _____ than a real witness or juror because they know it is an experiment （more or less cautious）.

Three studies that test lab validity（必背，AO3 论据）

Study	What it did	What it shows
Wagstaff et al. (_____) （2003）	Studied _____ witnesses （real）	Little evidence that _____, age or level of violence affected real testimony （weapon focus）, despite lab (and field) experiments suggesting they are influential
Yuille and Cutshall (_____) （1986）	Real witnesses to a _____ （robbery）	_____ effect of leading questions on real witnesses （limited）, though demonstrated in the lab
Ihlebaek et al. (_____) （2003）	Compared a _____ staged robbery (field) with _____ of the same robbery (lab) （live; film footage）	Film group recalled _____ details with greater accuracy （more）; errors _____ in both conditions （equal/same）. Labs _____ witness recall （overestimate）; rely on lab findings with caution

demand characteristics（需求特征）

Participants alter behaviour in response to the situation. Example: a participant guesses the aim is to test how stress affects recall and _____ to meet the researcher's expectations （recalls less）. This does not reflect a real-life situation and lowers validity.

中文理解：三个研究一句话记

Wagstaff：真证人身上武器聚焦等效应不明显。Yuille & Cutshall：真证人几乎不受引导性问题影响。Ihlebaek：实验室组记得更多更准，说明**实验室高估了记忆**。合起来一个结论：实验室发现拿到真实世界会打折扣。任选一个做 AO3 论据都够用。

Objectivity and subjectivity 客观性与主观性

Researchers should remain _____ when investigating （totally value free）: gather facts that may prove or disprove the hypothesis without bias.

Data type	Objectivity
Quantitative （e.g. guilty/not guilty counts）	Requires _____ interpretation （no/little）; minimises potential for bias; more _____ （objective）; obtained in field and lab experiments; makes research more _____ （scientific）
Qualitative （e.g. free recall）	Needs a _____ so quality or quantity of memory can be objectively analysed （coding method）

Generalisability 可推广性

Much research uses _____, often for course credit （students）. But _____ can be a witness and most of us could be called to _____ （anyone; jury service）. Real witnesses and jurors are far more diverse by _____ and _____ （age; educational level）. Risk: a body of knowledge that does not actually _____ to real cases （apply）.

Credibility 可信度

All methods achieve credibility by striving to be _____, _____ and _____ （reliable; valid; objective）. Criminal psychology research especially needs credibility because findings are applied by the _____ and _____ （courts; police）.

评价词六件套（AO3 词汇表，必背）

reliability（信度）· validity（效度）· objectivity（客观性）· subjectivity（主观性）· generalisability（可推广性）· credibility（可信度）

写 AO3 时先用词定性，再挂证据：比如「lab experiments have high reliability because standardised procedures allow replication」。每个词都要配一个犯罪心理学的具体例子，干写定义不给分。

Self-test 自测

1. The consistency of a finding is called _____. （reliability）
2. Data open to interpretation by a researcher is called _____. （subjectivity）
3. A study measuring what it claims to measure has _____. （validity）
4. How representative a sample is of the target population is called _____. （generalisability）

Ethics — BPS (2009) and the Four Guideline Areas 伦理

The rule books 规则来源

- _____ Code of Ethics and Conduct (_____) （British Psychological Society (BPS); 2009）: guidance for research and forensic practice such as formulations and treatment interventions.
- Practitioner psychologists（执业心理学家）follow additional guidance from their legal governing body, e.g. the _____ （Health and Care Professions Council (HCPC)）. Failure to follow guidelines can lead to being _____ （disbarred）.

Four guideline areas 四条主线（填表）

Area	In criminological research
Protection from harm 保护被试	Exposing someone to a real crime would be _____ （unethical）. Film clips are less distressing but can remind a person of _____ （a past similar experience, e.g. victim of a similar crime）. Allow _____ whenever they feel distressed （withdrawal）. Labs protect more than field or case studies because the event is _____ （artificial）
Deception and consent 欺骗与同意	Deception may be used to _____ demand characteristics, increasing _____ （minimise; validity）. Cost: lack of _____ （informed consent）. Labs are more likely to require consent; field studies may need it less but deception remains an issue. Where deception or consent are issues, _____ participants once the research is complete （debrief）
Right to withdraw 退出权	Less of an issue in field experiments; lab experiments should _____ offer it （always）. Debrief participants where withdrawal is an issue
Practical applications 应用	Research informs government _____ to tackle crime and reduce reoffending, and _____ practices to secure accurate convictions （policy-making; police）. Example: the _____, developed from Loftus' eyewitness research （cognitive interview）

中文理解：伦理题答题三件套

点出伦理问题 → 说明它在这个情境里怎么出现 → 给出处理办法。例如欺骗：用了欺骗就没法知情同意，但犯罪研究里欺骗是为了压住需求特征，处理办法是事后 debrief。只写名词不给满，必须挂情境。

Risk Management 风险管理

Why risk assessment 为什么做风险评估

All research should undertake a _____ to identify potential harm or hazards （risk assessment）. The same risk management from Unit 1 applies to criminological research, eyewitness work and offenders.

Risks by context 分情境风险评估

Context	Risks to assess
Staged field incident （actor fleeing a crime scene）	Witness _____; a _____ pursuing the actor; likelihood of _____ and falls （stress; bystander; trips）
Laboratory video footage	Potential _____ distress, especially if the participant has been a _____ of crime; stress or _____ when recalling the event （psychological; victim; embarrassment）
Working with offenders	Forensic psychologists undertake _____ risk assessments （regular）. Reoffending risk tools: the _____ （Offender Assessment System (OASys)）, designed to predict the probability of an offence causing _____ （serious harm）. Other tools predict likelihood of abuse, violence or specific offences

Risk assessment form: London Dungeon（课本 Activity 2 场景）

Risks identified	Who might be harmed and how	Severity	Likelihood	Action to manage
_____ during the experience （stress/fear）	_____ （visitors (participants)）			_____ before; debrief after （screen/consent）
Distress from recall of _____ （frightening figures）	Visitors with anxiety			Allow _____ （withdrawal）

中文理解：风险管理的答题格式

风险评估的格式是**四问**：有什么风险？谁可能受害、怎么受害？严重程度（高/中/低）？发生可能性（高/中/低）？最后给管理动作。考试里出现时通常只要两三问，但四问的框架要会。OASys 是 6.3.2 里少见的必背缩写，写全称：Offender Assessment System。

Spec 6.3.3: what to review 要复习什么

List	Contains	How it appears here
List A	Analysis of _____ data （quantitative）: graphs, descriptive statistics	Verdict counts, guilt ratings, recall scores from experiments and mock jury studies
List B	Decision making and interpretation of _____ statistics （inferential）	Deciding whether witness or juror differences are significant

Exam tip: go back through the _____ psychology methods and _____ psychology methods chapters to review these （social; cognitive）. 6.3.3 has no new statistics to memorise; it tests applying U1/U2 analysis to crime data.

The exam tip that changes how you revise 考试提醒

Any method can be examined 任何方法都可能考

The chapter describes lab and field experiments, but the exam could ask you to apply knowledge of **any research method** to criminological psychology, plus analyse data with **graphs and statistical tests**.

The 8-mark design frame 八分设计题骨架

Question type: *Discuss how [researcher] would go about conducting a laboratory experiment to investigate [question]. (8)*

Order	Component	Say something like
1	Sample and allocation	Recruit mock jurors; _____ allocate to conditions （randomly）
2	IV and DV	IV = defendant characteristic; DV = _____ （verdict or guilt rating）
3	Procedure	Same trial video except the manipulated characteristic; standardised evidence, instructions
4	Controls	Control extraneous variables so a _____ conclusion is possible （cause-and-effect）
5	Data analysis	Compare guilty verdicts with percentages, bar charts, an inferential test
6	One evaluation point	Control is a strength; artificial setting lowers _____ so be cautious generalising （ecological validity）

中文理解：这就是 Getting Started 清单的展开版

先写样本和 IV/DV，再写程序和控制，然后是数据分析，最后加一句评价，每项一两句正好铺满八分。最后一句评价前后呼应，是加分关键。

Exam Practice 真题（Textbook Exam Practice）

Question 1 — Michaela's mock jury study（4 + 2 marks）

Michaela used an opportunity sample of students from her local college, split into two groups. Both watched the same video of a witness giving evidence identifying the defendant, and decided guilty or not guilty. Group 1 were told the witness was **100% confident**; Group 2 were told **80% confident**. The higher the confidence, the more likely participants reached a guilty verdict.

a) Explain two strengths of Michaela using a mock jury research method to investigate jury decision-making. (4)

（Strength 1: control — same video, only confidence differs, so cause-and-effect. Strength 2: access — real jurors cannot be studied or discuss the deliberation room. 每个优点：一分点名词，一分挂 Michaela 的细节。）

b) Explain one way that Michaela could improve the generalisability of her mock jury study. (2)

Question 2 — Ethics of eyewitness research（2 marks）

Explain one ethical issue that should be considered when researching factors that influence eyewitness memory. (2)

（公式：问题名词（1 分）+ 情境表现和处理（1 分）。例如 protection from harm：影片可能唤起受害经历，给退出权并 debrief。）

Question 3 — The 8-mark design question（8 marks）

Fezile decides to conduct a laboratory experiment to investigate the influence of defendant characteristics on jury decision-making. Discuss how Fezile would go about conducting this laboratory experiment. (8)

（按六步骨架写：样本 → IV/DV → 程序 → 控制 → 分析 → 一句评价。）

Fill-in answers 答案

Page	Answers
p.2 lab basics	illegal · bias their testimony · watching films in a laboratory · weapon presence · leading question types · testimony provided · gathering · film; photographs · films, offences, suspects · recall · post-event
p.3 lab evaluation	standardised · replicate · extraneous; manipulated · cause-and-effect · artificiality · ecological validity · generalise · single isolated variable · pre-trial publicity · incomplete · unethical · previous experience · right to withdraw
p.4 field	more natural setting · artificially constructed · 2 · simulated crime/event; an actor · real visitors; stress · naturally; not have to · stages and manipulates · real · ecological validity · unaware · demand characteristics · situational · reliability · real · distress
p.5 mock jury	not permissible · talk · randomly · emulate · laboratory; video recordings; transcripts · simulation · verdict · Ruva, McEvoy and Bryant (2007) · good · cause-and-effect · fidelity · skip; restricted; 12 · no; role playing · student · debated · Mitchell; same · high · doubtful · low · strong · high · mixed
p.6 reliability & validity	high · lower · two identical people · more or less cautious · 2003 · real · weapon focus · 1986 · robbery · limited · 2003 · live; film footage · more · equal/same · overestimate · recalls less
p.7 objectivity etc.	totally value free · no/little · objective · scientific · coding method · students · anyone; jury service · age; educational level · apply · reliable; valid; objective · courts; police · reliability · subjectivity · validity · generalisability
p.8 ethics	British Psychological Society (BPS); 2009 · Health and Care Professions Council (HCPC) · disbarred · unethical · a past similar experience · withdrawal · artificial · minimise; validity · informed consent · debrief · always · policy-making; police · cognitive interview
p.9 risk	risk assessment · stress; bystander; trips · psychological; victim; embarrassment · regular · Offender Assessment System (OASys) · serious harm · stress/fear · visitors (participants) · screen/consent · frightening figures · withdrawal
p.10 data & exam	quantitative · inferential · social; cognitive · randomly · verdict or guilt rating · cause-and-effect · ecological validity

Model answer sketches 简要范文

Q1a: Strength 1: the mock jury method gave Michaela control over what jurors were exposed to (same video, only stated confidence differed), so a cause-and-effect conclusion about witness confidence and verdicts can be drawn. Strength 2: genuine jurors cannot be studied during a trial or deliberate, and cannot discuss the deliberation room afterwards, so mock juries are the only way to investigate jury decision-making directly.
Q1b: Use a sample drawn from a wider range of ages and educational backgrounds (e.g. random or stratified community sample), so it better represents potential jurors and findings generalise to real juries.
Q2: Protection from harm: watching a filmed crime may distress participants, especially past victims of similar crime; allow withdrawal and debrief.
Q3: See the six-step frame on p.10: sample with random allocation; IV = defendant characteristic; DV = verdict or guilt rating; standardised trial video except the manipulated characteristic; compare guilty verdicts with percentages/charts/inferential test; strength = control and cause-and-effect, limitation = artificial setting lowers ecological validity so generalise with caution.

Brain dump 脑内清空

Cover everything. Write everything you remember about 6.3 from memory: the three methods, their evaluations, the evaluation vocabulary, ethics and risk. Then check against this booklet and mark gaps.
